Huawei HCCDA-AI

5-Phase • 100 MCQ Exam Preparation Guide

English Edition

Question → 4 Options → Correct Answer → Explanation of Every Option

Exam basis: This guide is structured from the uploaded Huawei HCCDA-AI course plan. The source covers AI/ML fundamentals, Huawei Cloud EI services, ModelArts, deep learning frameworks, vision/OCR, HiLens, model testing, deployment, MLOps/CI-CD, mock exams, and certification readiness.

5 Phases: AI • ML • DL • CV • Huawei Cloud + DevOps/MLOps

Phase 1 — Artificial Intelligence (AI)

20 Questions — Focused exam practice for this phase.

Question 1: What is Artificial Intelligence (AI)?

A. A field focused on building systems that perform tasks associated with intelligent behavior

B. A method used only for storing files

C. A programming language for databases

D. A type of computer hardware

Correct Answer: A. A field focused on building systems that perform tasks associated with intelligent behavior

Why this is correct: A field focused on building systems that perform tasks associated with intelligent behavior directly matches the concept covered by the question.

Why B is incorrect: A method used only for storing files does not match the concept being tested.

Why C is incorrect: A programming language for databases does not match the concept being tested.

Why D is incorrect: A type of computer hardware does not match the concept being tested.

Question 2: Which AI type is designed for a specific task?

A. Weak or Narrow AI

B. Strong AI

C. General AI

D. Universal hardware AI

Correct Answer: A. Weak or Narrow AI

Why this is correct: Weak or Narrow AI directly matches the concept covered by the question.

Why B is incorrect: Strong AI does not match the concept being tested.

Why C is incorrect: General AI does not match the concept being tested.

Why D is incorrect: Universal hardware AI does not match the concept being tested.

Question 3: Which of the following is identified in the course as a key AI domain?

A. Computer Vision

B. Spreadsheet formatting

C. Disk partitioning

D. Printer management

Correct Answer: A. Computer Vision

Why this is correct: Computer Vision directly matches the concept covered by the question.

Why B is incorrect: Spreadsheet formatting does not match the concept being tested.

Why C is incorrect: Disk partitioning does not match the concept being tested.

Why D is incorrect: Printer management does not match the concept being tested.

Question 4: Which is another major AI domain covered in the course?

A. Natural Language Processing (NLP)

B. File compression

C. Network cabling

D. BIOS configuration

Correct Answer: A. Natural Language Processing (NLP)

Why this is correct: Natural Language Processing (NLP) directly matches the concept covered by the question.

Why B is incorrect: File compression does not match the concept being tested.

Why C is incorrect: Network cabling does not match the concept being tested.

Why D is incorrect: BIOS configuration does not match the concept being tested.

Question 5: Which technology trend is explicitly mentioned in the course?

A. Generative AI

B. Floppy-disk computing

C. CRT optimization

D. Manual data entry

Correct Answer: A. Generative AI

Why this is correct: Generative AI directly matches the concept covered by the question.

Why B is incorrect: Floppy-disk computing does not match the concept being tested.

Why C is incorrect: CRT optimization does not match the concept being tested.

Why D is incorrect: Manual data entry does not match the concept being tested.

Question 6: Which is listed as an AI adoption barrier?

A. Data availability

B. Keyboard layout

C. Monitor size

D. Printer speed

Correct Answer: A. Data availability

Why this is correct: Data availability directly matches the concept covered by the question.

Why B is incorrect: Keyboard layout does not match the concept being tested.

Why C is incorrect: Monitor size does not match the concept being tested.

Why D is incorrect: Printer speed does not match the concept being tested.

Question 7: Which other adoption barrier is mentioned?

A. Regulation

B. Mouse sensitivity

C. Screen brightness

D. File naming

Correct Answer: A. Regulation

Why this is correct: Regulation directly matches the concept covered by the question.

Why B is incorrect: Mouse sensitivity does not match the concept being tested.

Why C is incorrect: Screen brightness does not match the concept being tested.

Why D is incorrect: File naming does not match the concept being tested.

Question 8: What is one purpose of AI requirement analysis?

A. To understand functional and data requirements before implementation

B. To replace all testing

C. To remove stakeholders

D. To eliminate model evaluation

Correct Answer: A. To understand functional and data requirements before implementation

Why this is correct: To understand functional and data requirements before implementation directly matches the concept covered by the question.

Why B is incorrect: To replace all testing does not match the concept being tested.

Why C is incorrect: To remove stakeholders does not match the concept being tested.

Why D is incorrect: To eliminate model evaluation does not match the concept being tested.

Question 9: Which technique is mentioned for requirement elicitation?

A. Interviews

B. Pixel filtering

C. Image cropping

D. GPU overclocking

Correct Answer: A. Interviews

Why this is correct: Interviews directly matches the concept covered by the question.

Why B is incorrect: Pixel filtering does not match the concept being tested.

Why C is incorrect: Image cropping does not match the concept being tested.

Why D is incorrect: GPU overclocking does not match the concept being tested.

Question 10: What is a functional requirement for an AI system?

A. A requirement describing what the system should do

B. A requirement describing only the computer's brand

C. A requirement describing keyboard shortcuts

D. A requirement for monitor resolution

Correct Answer: A. A requirement describing what the system should do

Why this is correct: A requirement describing what the system should do directly matches the concept covered by the question.

Why B is incorrect: A requirement describing only the computer's brand does not match the concept being tested.

Why C is incorrect: A requirement describing keyboard shortcuts does not match the concept being tested.

Why D is incorrect: A requirement for monitor resolution does not match the concept being tested.

Question 11: Which is a non-functional requirement?

A. Performance

B. User's favorite color

C. File extension only

D. Keyboard language

Correct Answer: A. Performance

Why this is correct: Performance directly matches the concept covered by the question.

Why B is incorrect: User's favorite color does not match the concept being tested.

Why C is incorrect: File extension only does not match the concept being tested.

Why D is incorrect: Keyboard language does not match the concept being tested.

Question 12: Which AI service categories are included in Huawei Cloud EI?

A. Vision, NLP, speech, and OCR

B. Only spreadsheets and email

C. Only databases

D. Only network monitoring

Correct Answer: A. Vision, NLP, speech, and OCR

Why this is correct: Vision, NLP, speech, and OCR directly matches the concept covered by the question.

Why B is incorrect: Only spreadsheets and email does not match the concept being tested.

Why C is incorrect: Only databases does not match the concept being tested.

Why D is incorrect: Only network monitoring does not match the concept being tested.

Question 13: What does OCR generally do?

A. Extracts text from images or documents

B. Trains GPUs

C. Compresses videos

D. Creates network routes

Correct Answer: A. Extracts text from images or documents

Why this is correct: Extracts text from images or documents directly matches the concept covered by the question.

Why B is incorrect: Trains GPUs does not match the concept being tested.

Why C is incorrect: Compresses videos does not match the concept being tested.

Why D is incorrect: Creates network routes does not match the concept being tested.

Question 14: What does speech-to-text do?

A. Converts spoken language into text

B. Converts text into SQL tables

C. Compresses audio

D. Creates image masks

Correct Answer: A. Converts spoken language into text

Why this is correct: Converts spoken language into text directly matches the concept covered by the question.

Why B is incorrect: Converts text into SQL tables does not match the concept being tested.

Why C is incorrect: Compresses audio does not match the concept being tested.

Why D is incorrect: Creates image masks does not match the concept being tested.

Question 15: What is sentiment analysis used for?

A. Determining the sentiment expressed in text

B. Detecting CPU temperature

C. Resizing images

D. Creating cloud storage buckets

Correct Answer: A. Determining the sentiment expressed in text

Why this is correct: Determining the sentiment expressed in text directly matches the concept covered by the question.

Why B is incorrect: Detecting CPU temperature does not match the concept being tested.

Why C is incorrect: Resizing images does not match the concept being tested.

Why D is incorrect: Creating cloud storage buckets does not match the concept being tested.

Question 16: Why is AI certification exam preparation included in the course?

A. To review domains, sample questions, exam strategy, and answer structure

B. To replace practical work

C. To teach only hardware repair

D. To eliminate revision

Correct Answer: A. To review domains, sample questions, exam strategy, and answer structure

Why this is correct: To review domains, sample questions, exam strategy, and answer structure directly matches the concept covered by the question.

Why B is incorrect: To replace practical work does not match the concept being tested.

Why C is incorrect: To teach only hardware repair does not match the concept being tested.

Why D is incorrect: To eliminate revision does not match the concept being tested.

Question 17: Which AI application area is included in the course's project examples?

A. Smart retail

B. Printer repair

C. Operating-system installation

D. Keyboard design

Correct Answer: A. Smart retail

Why this is correct: Smart retail directly matches the concept covered by the question.

Why B is incorrect: Printer repair does not match the concept being tested.

Why C is incorrect: Operating-system installation does not match the concept being tested.

Why D is incorrect: Keyboard design does not match the concept being tested.

Question 18: What should be identified when drafting an AI project requirement specification?

A. Stakeholders and user goals

B. Only the developer's laptop model

C. Only the programming language

D. Only the database password

Correct Answer: A. Stakeholders and user goals

Why this is correct: Stakeholders and user goals directly matches the concept covered by the question.

Why B is incorrect: Only the developer's laptop model does not match the concept being tested.

Why C is incorrect: Only the programming language does not match the concept being tested.

Why D is incorrect: Only the database password does not match the concept being tested.

Question 19: Why should AI requirements be mapped to available cloud tools?

A. To align business goals with suitable AI services, APIs, or models

B. To avoid defining the problem

C. To remove all architecture decisions

D. To prevent testing

Correct Answer: A. To align business goals with suitable AI services, APIs, or models

Why this is correct: To align business goals with suitable AI services, APIs, or models directly matches the concept covered by the question.

Why B is incorrect: To avoid defining the problem does not match the concept being tested.

Why C is incorrect: To remove all architecture decisions does not match the concept being tested.

Why D is incorrect: To prevent testing does not match the concept being tested.

Question 20: Which deployment choice is explicitly considered during AI application design?

A. Edge, cloud, or hybrid

B. Keyboard, mouse, or monitor

C. Windows, Linux, or BIOS only

D. JPEG, PNG, or GIF only

Correct Answer: A. Edge, cloud, or hybrid

Why this is correct: Edge, cloud, or hybrid directly matches the concept covered by the question.

Why B is incorrect: Keyboard, mouse, or monitor does not match the concept being tested.

Why C is incorrect: Windows, Linux, or BIOS only does not match the concept being tested.

Why D is incorrect: JPEG, PNG, or GIF only does not match the concept being tested.

Phase 2 — Machine Learning (ML)

20 Questions — Focused exam practice for this phase.

Question 1: What is machine learning?

A. A method where models learn patterns from data to make predictions or decisions

B. A method only for installing software

C. A type of computer monitor

D. A network cable standard

Correct Answer: A. A method where models learn patterns from data to make predictions or decisions

Why this is correct: A method where models learn patterns from data to make predictions or decisions directly matches the concept covered by the question.

Why B is incorrect: A method only for installing software does not match the concept being tested.

Why C is incorrect: A type of computer monitor does not match the concept being tested.

Why D is incorrect: A network cable standard does not match the concept being tested.

Question 2: Which Python library is used in the course for basic machine learning?

A. Scikit-learn

B. Flask only

C. ReportLab

D. Waitress

Correct Answer: A. Scikit-learn

Why this is correct: Scikit-learn directly matches the concept covered by the question.

Why B is incorrect: Flask only does not match the concept being tested.

Why C is incorrect: ReportLab does not match the concept being tested.

Why D is incorrect: Waitress does not match the concept being tested.

Question 3: Which library is used for data manipulation?

A. Pandas

B. OpenCV only

C. TensorFlow only

D. FunctionGraph

Correct Answer: A. Pandas

Why this is correct: Pandas directly matches the concept covered by the question.

Why B is incorrect: OpenCV only does not match the concept being tested.

Why C is incorrect: TensorFlow only does not match the concept being tested.

Why D is incorrect: FunctionGraph does not match the concept being tested.

Question 4: What is a Pandas DataFrame?

A. A tabular data structure used for data manipulation and analysis

B. A neural network layer

C. A cloud API endpoint

D. A camera sensor

Correct Answer: A. A tabular data structure used for data manipulation and analysis

Why this is correct: A tabular data structure used for data manipulation and analysis directly matches the concept covered by the question.

Why B is incorrect: A neural network layer does not match the concept being tested.

Why C is incorrect: A cloud API endpoint does not match the concept being tested.

Why D is incorrect: A camera sensor does not match the concept being tested.

Question 5: Which task is specifically practiced with Pandas?

A. Filtering and grouping data

B. Camera calibration

C. GPU firmware updates

D. API gateway installation

Correct Answer: A. Filtering and grouping data

Why this is correct: Filtering and grouping data directly matches the concept covered by the question.

Why B is incorrect: Camera calibration does not match the concept being tested.

Why C is incorrect: GPU firmware updates does not match the concept being tested.

Why D is incorrect: API gateway installation does not match the concept being tested.

Question 6: How are missing values handled during data preparation?

A. They are identified and treated using appropriate data-cleaning methods

B. They are always ignored without analysis

C. They are converted into hardware drivers

D. They are sent directly to a camera

Correct Answer: A. They are identified and treated using appropriate data-cleaning methods

Why this is correct: They are identified and treated using appropriate data-cleaning methods directly matches the concept covered by the question.

Why B is incorrect: They are always ignored without analysis does not match the concept being tested.

Why C is incorrect: They are converted into hardware drivers does not match the concept being tested.

Why D is incorrect: They are sent directly to a camera does not match the concept being tested.

Question 7: What is a basic classification model used for?

A. Assigning input samples to predefined classes

B. Compressing a dataset

C. Changing a CPU clock speed

D. Creating a cloud account

Correct Answer: A. Assigning input samples to predefined classes

Why this is correct: Assigning input samples to predefined classes directly matches the concept covered by the question.

Why B is incorrect: Compressing a dataset does not match the concept being tested.

Why C is incorrect: Changing a CPU clock speed does not match the concept being tested.

Why D is incorrect: Creating a cloud account does not match the concept being tested.

Question 8: Which metric is explicitly mentioned for simple classifier evaluation?

A. Accuracy

B. Screen resolution

C. Network bandwidth

D. Disk capacity

Correct Answer: A. Accuracy

Why this is correct: Accuracy directly matches the concept covered by the question.

Why B is incorrect: Screen resolution does not match the concept being tested.

Why C is incorrect: Network bandwidth does not match the concept being tested.

Why D is incorrect: Disk capacity does not match the concept being tested.

Question 9: What is a training dataset?

A. Data used to learn model parameters

B. Data used only for final presentation

C. A cloud billing report

D. A hardware inventory

Correct Answer: A. Data used to learn model parameters

Why this is correct: Data used to learn model parameters directly matches the concept covered by the question.

Why B is incorrect: Data used only for final presentation does not match the concept being tested.

Why C is incorrect: A cloud billing report does not match the concept being tested.

Why D is incorrect: A hardware inventory does not match the concept being tested.

Question 10: Why is evaluation data kept separate from training data?

A. To estimate how well the model generalizes to unseen data

B. To increase the number of labels

C. To eliminate preprocessing

D. To make the CPU faster

Correct Answer: A. To estimate how well the model generalizes to unseen data

Why this is correct: To estimate how well the model generalizes to unseen data directly matches the concept covered by the question.

Why B is incorrect: To increase the number of labels does not match the concept being tested.

Why C is incorrect: To eliminate preprocessing does not match the concept being tested.

Why D is incorrect: To make the CPU faster does not match the concept being tested.

Question 11: What is a model's prediction?

A. The output produced by a trained model for an input

B. A database password

C. A cloud storage bucket

D. A Python package name

Correct Answer: A. The output produced by a trained model for an input

Why this is correct: The output produced by a trained model for an input directly matches the concept covered by the question.

Why B is incorrect: A database password does not match the concept being tested.

Why C is incorrect: A cloud storage bucket does not match the concept being tested.

Why D is incorrect: A Python package name does not match the concept being tested.

Question 12: What is model performance testing concerned with?

A. Metrics such as accuracy and latency

B. Monitor size only

C. Keyboard response time only

D. File naming conventions

Correct Answer: A. Metrics such as accuracy and latency

Why this is correct: Metrics such as accuracy and latency directly matches the concept covered by the question.

Why B is incorrect: Monitor size only does not match the concept being tested.

Why C is incorrect: Keyboard response time only does not match the concept being tested.

Why D is incorrect: File naming conventions does not match the concept being tested.

Question 13: What does a confusion matrix help analyze?

A. Classification errors across actual and predicted classes

B. Cloud billing only

C. Image file compression

D. CPU temperature

Correct Answer: A. Classification errors across actual and predicted classes

Why this is correct: Classification errors across actual and predicted classes directly matches the concept covered by the question.

Why B is incorrect: Cloud billing only does not match the concept being tested.

Why C is incorrect: Image file compression does not match the concept being tested.

Why D is incorrect: CPU temperature does not match the concept being tested.

Question 14: What is a false positive?

A. A negative case incorrectly predicted as positive

B. A positive case correctly predicted as positive

C. A missing Python package

D. A cloud storage object

Correct Answer: A. A negative case incorrectly predicted as positive

Why this is correct: A negative case incorrectly predicted as positive directly matches the concept covered by the question.

Why B is incorrect: A positive case correctly predicted as positive does not match the concept being tested.

Why C is incorrect: A missing Python package does not match the concept being tested.

Why D is incorrect: A cloud storage object does not match the concept being tested.

Question 15: What is a false negative?

A. A positive case incorrectly predicted as negative

B. A negative case correctly predicted as negative

C. A successful API call

D. A correct OCR extraction

Correct Answer: A. A positive case incorrectly predicted as negative

Why this is correct: A positive case incorrectly predicted as negative directly matches the concept covered by the question.

Why B is incorrect: A negative case correctly predicted as negative does not match the concept being tested.

Why C is incorrect: A successful API call does not match the concept being tested.

Why D is incorrect: A correct OCR extraction does not match the concept being tested.

Question 16: What is model optimization intended to improve?

A. Model performance and/or efficiency for the target use case

B. Only document formatting

C. Only hardware appearance

D. Only file names

Correct Answer: A. Model performance and/or efficiency for the target use case

Why this is correct: Model performance and/or efficiency for the target use case directly matches the concept covered by the question.

Why B is incorrect: Only document formatting does not match the concept being tested.

Why C is incorrect: Only hardware appearance does not match the concept being tested.

Why D is incorrect: Only file names does not match the concept being tested.

Question 17: What is an A/B test in model iteration?

A. A comparison of two model or system variants under defined conditions

B. A method for deleting models

C. A way to rename datasets

D. A hardware diagnostic

Correct Answer: A. A comparison of two model or system variants under defined conditions

Why this is correct: A comparison of two model or system variants under defined conditions directly matches the concept covered by the question.

Why B is incorrect: A method for deleting models does not match the concept being tested.

Why C is incorrect: A way to rename datasets does not match the concept being tested.

Why D is incorrect: A hardware diagnostic does not match the concept being tested.

Question 18: Why is dataset versioning useful?

A. It improves reproducibility and traceability of data changes

B. It removes the need for testing

C. It prevents model evaluation

D. It changes a camera into a server

Correct Answer: A. It improves reproducibility and traceability of data changes

Why this is correct: It improves reproducibility and traceability of data changes directly matches the concept covered by the question.

Why B is incorrect: It removes the need for testing does not match the concept being tested.

Why C is incorrect: It prevents model evaluation does not match the concept being tested.

Why D is incorrect: It changes a camera into a server does not match the concept being tested.

Question 19: What can trigger retraining in an ML system?

A. A significant drop in performance or detected drift

B. A keyboard change

C. A monitor upgrade

D. A new PDF filename

Correct Answer: A. A significant drop in performance or detected drift

Why this is correct: A significant drop in performance or detected drift directly matches the concept covered by the question.

Why B is incorrect: A keyboard change does not match the concept being tested.

Why C is incorrect: A monitor upgrade does not match the concept being tested.

Why D is incorrect: A new PDF filename does not match the concept being tested.

Question 20: What is data drift?

A. A change in input-data distribution that can affect model performance

B. A change in monitor resolution

C. A change in source-code indentation

D. A change in printer toner

Correct Answer: A. A change in input-data distribution that can affect model performance

Why this is correct: A change in input-data distribution that can affect model performance directly matches the concept covered by the question.

Why B is incorrect: A change in monitor resolution does not match the concept being tested.

Why C is incorrect: A change in source-code indentation does not match the concept being tested.

Why D is incorrect: A change in printer toner does not match the concept being tested.

Phase 3 — Deep Learning (DL)

20 Questions — Focused exam practice for this phase.

Question 1: What is a neural network made of at a basic level?

A. Neurons and layers

B. Only database tables

C. Only image files

D. Only cloud buckets

Correct Answer: A. Neurons and layers

Why this is correct: Neurons and layers directly matches the concept covered by the question.

Why B is incorrect: Only database tables does not match the concept being tested.

Why C is incorrect: Only image files does not match the concept being tested.

Why D is incorrect: Only cloud buckets does not match the concept being tested.

Question 2: What is an activation function used for?

A. Introducing non-linearity into neural network computations

B. Storing datasets

C. Creating cloud accounts

D. Compressing images

Correct Answer: A. Introducing non-linearity into neural network computations

Why this is correct: Introducing non-linearity into neural network computations directly matches the concept covered by the question.

Why B is incorrect: Storing datasets does not match the concept being tested.

Why C is incorrect: Creating cloud accounts does not match the concept being tested.

Why D is incorrect: Compressing images does not match the concept being tested.

Question 3: Which activation functions are explicitly listed in the course?

A. ReLU, Sigmoid, and Softmax

B. JPEG, PNG, GIF

C. REST, SOAP, FTP

D. CSV, JSON, XML

Correct Answer: A. ReLU, Sigmoid, and Softmax

Why this is correct: ReLU, Sigmoid, and Softmax directly matches the concept covered by the question.

Why B is incorrect: JPEG, PNG, GIF does not match the concept being tested.

Why C is incorrect: REST, SOAP, FTP does not match the concept being tested.

Why D is incorrect: CSV, JSON, XML does not match the concept being tested.

Question 4: What is forward propagation?

A. Passing input through network layers to produce an output

B. Deleting model weights

C. Uploading a dataset to OBS

D. Changing a camera lens

Correct Answer: A. Passing input through network layers to produce an output

Why this is correct: Passing input through network layers to produce an output directly matches the concept covered by the question.

Why B is incorrect: Deleting model weights does not match the concept being tested.

Why C is incorrect: Uploading a dataset to OBS does not match the concept being tested.

Why D is incorrect: Changing a camera lens does not match the concept being tested.

Question 5: What is a loss function used for?

A. Measuring the discrepancy between predictions and target values

B. Creating cloud credentials

C. Compressing datasets

D. Detecting network cables

Correct Answer: A. Measuring the discrepancy between predictions and target values

Why this is correct: Measuring the discrepancy between predictions and target values directly matches the concept covered by the question.

Why B is incorrect: Creating cloud credentials does not match the concept being tested.

Why C is incorrect: Compressing datasets does not match the concept being tested.

Why D is incorrect: Detecting network cables does not match the concept being tested.

Question 6: What is a CNN primarily designed to process effectively?

A. Grid-like data such as images

B. Only SQL queries

C. Only audio cables

D. Only cloud billing records

Correct Answer: A. Grid-like data such as images

Why this is correct: Grid-like data such as images directly matches the concept covered by the question.

Why B is incorrect: Only SQL queries does not match the concept being tested.

Why C is incorrect: Only audio cables does not match the concept being tested.

Why D is incorrect: Only cloud billing records does not match the concept being tested.

Question 7: What does a convolutional filter learn?

A. Local feature patterns from input data

B. Cloud passwords

C. File extensions

D. Hardware serial numbers

Correct Answer: A. Local feature patterns from input data

Why this is correct: Local feature patterns from input data directly matches the concept covered by the question.

Why B is incorrect: Cloud passwords does not match the concept being tested.

Why C is incorrect: File extensions does not match the concept being tested.

Why D is incorrect: Hardware serial numbers does not match the concept being tested.

Question 8: What is pooling commonly used for in CNNs?

A. Reducing spatial dimensions while retaining useful information

B. Creating API credentials

C. Increasing database rows

D. Uploading code to Git

Correct Answer: A. Reducing spatial dimensions while retaining useful information

Why this is correct: Reducing spatial dimensions while retaining useful information directly matches the concept covered by the question.

Why B is incorrect: Creating API credentials does not match the concept being tested.

Why C is incorrect: Increasing database rows does not match the concept being tested.

Why D is incorrect: Uploading code to Git does not match the concept being tested.

Question 9: Which CNN task is explicitly practiced in the course?

A. Image classification

B. Email account creation

C. Network routing

D. Spreadsheet formatting

Correct Answer: A. Image classification

Why this is correct: Image classification directly matches the concept covered by the question.

Why B is incorrect: Email account creation does not match the concept being tested.

Why C is incorrect: Network routing does not match the concept being tested.

Why D is incorrect: Spreadsheet formatting does not match the concept being tested.

Question 10: What is an RNN designed for?

A. Sequential data

B. Only static images

C. Only database indexes

D. Only cloud storage

Correct Answer: A. Sequential data

Why this is correct: Sequential data directly matches the concept covered by the question.

Why B is incorrect: Only static images does not match the concept being tested.

Why C is incorrect: Only database indexes does not match the concept being tested.

Why D is incorrect: Only cloud storage does not match the concept being tested.

Question 11: What is one key difference between CNNs and RNNs?

A. CNNs are commonly used for spatial patterns, while RNNs are designed for sequential dependencies

B. CNNs only work on text and RNNs only on images

C. They are exactly the same architecture

D. Neither can learn from data

Correct Answer: A. CNNs are commonly used for spatial patterns, while RNNs are designed for sequential dependencies

Why this is correct: CNNs are commonly used for spatial patterns, while RNNs are designed for sequential dependencies directly matches the concept covered by the question.

Why B is incorrect: CNNs only work on text and RNNs only on images does not match the concept being tested.

Why C is incorrect: They are exactly the same architecture does not match the concept being tested.

Why D is incorrect: Neither can learn from data does not match the concept being tested.

Question 12: Which two deep learning frameworks are compared in the course?

A. TensorFlow and PyTorch

B. Pandas and NumPy

C. Flask and Django

D. OBS and FunctionGraph

Correct Answer: A. TensorFlow and PyTorch

Why this is correct: TensorFlow and PyTorch directly matches the concept covered by the question.

Why B is incorrect: Pandas and NumPy does not match the concept being tested.

Why C is incorrect: Flask and Django does not match the concept being tested.

Why D is incorrect: OBS and FunctionGraph does not match the concept being tested.

Question 13: What is Keras used for in the course?

A. Defining a CNN architecture with TensorFlow

B. Creating OBS buckets

C. Managing cloud billing

D. Calling OCR APIs only

Correct Answer: A. Defining a CNN architecture with TensorFlow

Why this is correct: Defining a CNN architecture with TensorFlow directly matches the concept covered by the question.

Why B is incorrect: Creating OBS buckets does not match the concept being tested.

Why C is incorrect: Managing cloud billing does not match the concept being tested.

Why D is incorrect: Calling OCR APIs only does not match the concept being tested.

Question 14: Which dataset is given as an example for CNN training?

A. Fashion MNIST

B. A cloud billing table

C. A network log only

D. A PDF of certificates

Correct Answer: A. Fashion MNIST

Why this is correct: Fashion MNIST directly matches the concept covered by the question.

Why B is incorrect: A cloud billing table does not match the concept being tested.

Why C is incorrect: A network log only does not match the concept being tested.

Why D is incorrect: A PDF of certificates does not match the concept being tested.

Question 15: What should be done after training a CNN?

A. Validate and evaluate its performance

B. Immediately delete the dataset

C. Change the camera lens

D. Disable all logging

Correct Answer: A. Validate and evaluate its performance

Why this is correct: Validate and evaluate its performance directly matches the concept covered by the question.

Why B is incorrect: Immediately delete the dataset does not match the concept being tested.

Why C is incorrect: Change the camera lens does not match the concept being tested.

Why D is incorrect: Disable all logging does not match the concept being tested.

Question 16: What is transfer learning?

A. Using a pretrained model as a starting point for a new task

B. Transferring files between folders only

C. Moving a laptop to another room

D. Copying cloud credentials

Correct Answer: A. Using a pretrained model as a starting point for a new task

Why this is correct: Using a pretrained model as a starting point for a new task directly matches the concept covered by the question.

Why B is incorrect: Transferring files between folders only does not match the concept being tested.

Why C is incorrect: Moving a laptop to another room does not match the concept being tested.

Why D is incorrect: Copying cloud credentials does not match the concept being tested.

Question 17: Why can pretrained models be useful?

A. They can provide learned representations that reduce the work needed for a new task

B. They guarantee perfect accuracy

C. They remove the need for evaluation

D. They eliminate all data requirements

Correct Answer: A. They can provide learned representations that reduce the work needed for a new task

Why this is correct: They can provide learned representations that reduce the work needed for a new task directly matches the concept covered by the question.

Why B is incorrect: They guarantee perfect accuracy does not match the concept being tested.

Why C is incorrect: They remove the need for evaluation does not match the concept being tested.

Why D is incorrect: They eliminate all data requirements does not match the concept being tested.

Question 18: What is a deep learning model's inference stage?

A. Using the trained model to produce predictions on new inputs

B. Writing the initial dataset

C. Creating hardware specifications

D. Installing a monitor

Correct Answer: A. Using the trained model to produce predictions on new inputs

Why this is correct: Using the trained model to produce predictions on new inputs directly matches the concept covered by the question.

Why B is incorrect: Writing the initial dataset does not match the concept being tested.

Why C is incorrect: Creating hardware specifications does not match the concept being tested.

Why D is incorrect: Installing a monitor does not match the concept being tested.

Question 19: What is a training epoch?

A. One complete pass through the training dataset

B. One model parameter

C. One API endpoint

D. One image pixel

Correct Answer: A. One complete pass through the training dataset

Why this is correct: One complete pass through the training dataset directly matches the concept covered by the question.

Why B is incorrect: One model parameter does not match the concept being tested.

Why C is incorrect: One API endpoint does not match the concept being tested.

Why D is incorrect: One image pixel does not match the concept being tested.

Question 20: Why are loss curves useful?

A. They help visualize training behavior and identify potential optimization problems

B. They replace all test data

C. They create cloud credentials

D. They increase camera resolution

Correct Answer: A. They help visualize training behavior and identify potential optimization problems

Why this is correct: They help visualize training behavior and identify potential optimization problems directly matches the concept covered by the question.

Why B is incorrect: They replace all test data does not match the concept being tested.

Why C is incorrect: They create cloud credentials does not match the concept being tested.

Why D is incorrect: They increase camera resolution does not match the concept being tested.

Phase 4 — Computer Vision (CV)

20 Questions — Focused exam practice for this phase.

Question 1: Which computer vision service category is included in Huawei Cloud EI?

A. Vision

B. Accounting

C. Payroll

D. Word processing

Correct Answer: A. Vision

Why this is correct: Vision directly matches the concept covered by the question.

Why B is incorrect: Accounting does not match the concept being tested.

Why C is incorrect: Payroll does not match the concept being tested.

Why D is incorrect: Word processing does not match the concept being tested.

Question 2: What is image classification?

A. Assigning an image to one or more predefined categories

B. Compressing an image

C. Creating a cloud account

D. Writing an API specification

Correct Answer: A. Assigning an image to one or more predefined categories

Why this is correct: Assigning an image to one or more predefined categories directly matches the concept covered by the question.

Why B is incorrect: Compressing an image does not match the concept being tested.

Why C is incorrect: Creating a cloud account does not match the concept being tested.

Why D is incorrect: Writing an API specification does not match the concept being tested.

Question 3: What is object detection?

A. Finding objects and their locations in an image

B. Converting audio to text

C. Managing cloud billing

D. Cleaning CSV files

Correct Answer: A. Finding objects and their locations in an image

Why this is correct: Finding objects and their locations in an image directly matches the concept covered by the question.

Why B is incorrect: Converting audio to text does not match the concept being tested.

Why C is incorrect: Managing cloud billing does not match the concept being tested.

Why D is incorrect: Cleaning CSV files does not match the concept being tested.

Question 4: What is a bounding box?

A. A rectangle representing an object's location

B. A cloud storage bucket

C. A neural-network optimizer

D. A Python package

Correct Answer: A. A rectangle representing an object's location

Why this is correct: A rectangle representing an object's location directly matches the concept covered by the question.

Why B is incorrect: A cloud storage bucket does not match the concept being tested.

Why C is incorrect: A neural-network optimizer does not match the concept being tested.

Why D is incorrect: A Python package does not match the concept being tested.

Question 5: What is image tagging?

A. Assigning descriptive labels to image content

B. Deleting image metadata

C. Creating API credentials

D. Changing CPU speed

Correct Answer: A. Assigning descriptive labels to image content

Why this is correct: Assigning descriptive labels to image content directly matches the concept covered by the question.

Why B is incorrect: Deleting image metadata does not match the concept being tested.

Why C is incorrect: Creating API credentials does not match the concept being tested.

Why D is incorrect: Changing CPU speed does not match the concept being tested.

Question 6: Which task is used as a HiLens example in the course?

A. Face detection or object tracking

B. Database normalization

C. Spreadsheet formatting

D. Email filtering

Correct Answer: A. Face detection or object tracking

Why this is correct: Face detection or object tracking directly matches the concept covered by the question.

Why B is incorrect: Database normalization does not match the concept being tested.

Why C is incorrect: Spreadsheet formatting does not match the concept being tested.

Why D is incorrect: Email filtering does not match the concept being tested.

Question 7: What is OCR in a computer vision pipeline?

A. Extracting text from visual documents

B. Training an RNN

C. Monitoring CPU temperature

D. Managing cloud invoices

Correct Answer: A. Extracting text from visual documents

Why this is correct: Extracting text from visual documents directly matches the concept covered by the question.

Why B is incorrect: Training an RNN does not match the concept being tested.

Why C is incorrect: Monitoring CPU temperature does not match the concept being tested.

Why D is incorrect: Managing cloud invoices does not match the concept being tested.

Question 8: What is table OCR useful for?

A. Extracting structured information from invoices, reports, and receipts

B. Creating video streams

C. Training only audio models

D. Changing image colors

Correct Answer: A. Extracting structured information from invoices, reports, and receipts

Why this is correct: Extracting structured information from invoices, reports, and receipts directly matches the concept covered by the question.

Why B is incorrect: Creating video streams does not match the concept being tested.

Why C is incorrect: Training only audio models does not match the concept being tested.

Why D is incorrect: Changing image colors does not match the concept being tested.

Question 9: What is image preprocessing?

A. Preparing image data into a suitable form before model inference or training

B. Creating cloud accounts

C. Writing project contracts

D. Deleting annotations

Correct Answer: A. Preparing image data into a suitable form before model inference or training

Why this is correct: Preparing image data into a suitable form before model inference or training directly matches the concept covered by the question.

Why B is incorrect: Creating cloud accounts does not match the concept being tested.

Why C is incorrect: Writing project contracts does not match the concept being tested.

Why D is incorrect: Deleting annotations does not match the concept being tested.

Question 10: Why can confidence scores be useful in object recognition?

A. They indicate how strongly the model supports a prediction

B. They change the camera sensor

C. They replace all labels

D. They automatically fix every error

Correct Answer: A. They indicate how strongly the model supports a prediction

Why this is correct: They indicate how strongly the model supports a prediction directly matches the concept covered by the question.

Why B is incorrect: They change the camera sensor does not match the concept being tested.

Why C is incorrect: They replace all labels does not match the concept being tested.

Why D is incorrect: They automatically fix every error does not match the concept being tested.

Question 11: What is real-time visual inference?

A. Generating predictions quickly enough for an interactive or time-sensitive application

B. Running only batch jobs

C. Editing image filenames

D. Training without data

Correct Answer: A. Generating predictions quickly enough for an interactive or time-sensitive application

Why this is correct: Generating predictions quickly enough for an interactive or time-sensitive application directly matches the concept covered by the question.

Why B is incorrect: Running only batch jobs does not match the concept being tested.

Why C is incorrect: Editing image filenames does not match the concept being tested.

Why D is incorrect: Training without data does not match the concept being tested.

Question 12: What is edge vision?

A. Running visual AI inference near the data source or device

B. Using only image edges

C. Storing all data in spreadsheets

D. Running every model only on a central server

Correct Answer: A. Running visual AI inference near the data source or device

Why this is correct: Running visual AI inference near the data source or device directly matches the concept covered by the question.

Why B is incorrect: Using only image edges does not match the concept being tested.

Why C is incorrect: Storing all data in spreadsheets does not match the concept being tested.

Why D is incorrect: Running every model only on a central server does not match the concept being tested.

Question 13: What is video analytics?

A. Analyzing video streams to detect events, objects, or patterns

B. Compressing PDFs

C. Managing passwords

D. Creating CSV files

Correct Answer: A. Analyzing video streams to detect events, objects, or patterns

Why this is correct: Analyzing video streams to detect events, objects, or patterns directly matches the concept covered by the question.

Why B is incorrect: Compressing PDFs does not match the concept being tested.

Why C is incorrect: Managing passwords does not match the concept being tested.

Why D is incorrect: Creating CSV files does not match the concept being tested.

Question 14: Why might a retail system use computer vision?

A. To recognize goods or analyze customer/shelf activity

B. To format documents

C. To configure BIOS

D. To manage keyboard drivers

Correct Answer: A. To recognize goods or analyze customer/shelf activity

Why this is correct: To recognize goods or analyze customer/shelf activity directly matches the concept covered by the question.

Why B is incorrect: To format documents does not match the concept being tested.

Why C is incorrect: To configure BIOS does not match the concept being tested.

Why D is incorrect: To manage keyboard drivers does not match the concept being tested.

Question 15: What is the purpose of evaluating an OCR API?

A. To compare its outputs with expected or ground-truth results

B. To increase monitor size

C. To rename image files

D. To install a CPU

Correct Answer: A. To compare its outputs with expected or ground-truth results

Why this is correct: To compare its outputs with expected or ground-truth results directly matches the concept covered by the question.

Why B is incorrect: To increase monitor size does not match the concept being tested.

Why C is incorrect: To rename image files does not match the concept being tested.

Why D is incorrect: To install a CPU does not match the concept being tested.

Question 16: Which metrics are explicitly mentioned for OCR evaluation in the course?

A. Precision and recall summaries

B. GPU temperature and voltage

C. Disk size and RAM speed

D. Screen brightness and contrast

Correct Answer: A. Precision and recall summaries

Why this is correct: Precision and recall summaries directly matches the concept covered by the question.

Why B is incorrect: GPU temperature and voltage does not match the concept being tested.

Why C is incorrect: Disk size and RAM speed does not match the concept being tested.

Why D is incorrect: Screen brightness and contrast does not match the concept being tested.

Question 17: What should be logged when testing an OCR API?

A. Response time and accuracy

B. Only the developer's name

C. Only the file extension

D. Only monitor resolution

Correct Answer: A. Response time and accuracy

Why this is correct: Response time and accuracy directly matches the concept covered by the question.

Why B is incorrect: Only the developer's name does not match the concept being tested.

Why C is incorrect: Only the file extension does not match the concept being tested.

Why D is incorrect: Only monitor resolution does not match the concept being tested.

Question 18: What can be an edge case for an OCR API?

A. An unsupported or problematic image type

B. A new keyboard

C. A larger monitor

D. A different desktop wallpaper

Correct Answer: A. An unsupported or problematic image type

Why this is correct: An unsupported or problematic image type directly matches the concept covered by the question.

Why B is incorrect: A new keyboard does not match the concept being tested.

Why C is incorrect: A larger monitor does not match the concept being tested.

Why D is incorrect: A different desktop wallpaper does not match the concept being tested.

Question 19: What is a practical computer vision deployment example in the course?

A. Goods recognition using camera + HiLens + ModelArts API

B. Spreadsheet editing

C. Email archiving

D. Printer configuration

Correct Answer: A. Goods recognition using camera + HiLens + ModelArts API

Why this is correct: Goods recognition using camera + HiLens + ModelArts API directly matches the concept covered by the question.

Why B is incorrect: Spreadsheet editing does not match the concept being tested.

Why C is incorrect: Email archiving does not match the concept being tested.

Why D is incorrect: Printer configuration does not match the concept being tested.

Question 20: What is the main benefit of combining edge and cloud vision?

A. It can balance local responsiveness with cloud-based AI capabilities

B. It eliminates all networking

C. It guarantees zero latency

D. It removes the need for models

Correct Answer: A. It can balance local responsiveness with cloud-based AI capabilities

Why this is correct: It can balance local responsiveness with cloud-based AI capabilities directly matches the concept covered by the question.

Why B is incorrect: It eliminates all networking does not match the concept being tested.

Why C is incorrect: It guarantees zero latency does not match the concept being tested.

Why D is incorrect: It removes the need for models does not match the concept being tested.

Phase 5 — Huawei Cloud + DevOps/MLOps

20 Questions — Focused exam practice for this phase.

Question 1: What is Huawei ModelArts?

A. A Huawei Cloud platform for AI development and lifecycle activities

B. A spreadsheet editor

C. A physical camera

D. A programming language

Correct Answer: A. A Huawei Cloud platform for AI development and lifecycle activities

Why this is correct: A Huawei Cloud platform for AI development and lifecycle activities directly matches the concept covered by the question.

Why B is incorrect: A spreadsheet editor does not match the concept being tested.

Why C is incorrect: A physical camera does not match the concept being tested.

Why D is incorrect: A programming language does not match the concept being tested.

Question 2: Which ModelArts capabilities are mentioned in the course?

A. Datasets, training, deployment, notebooks, AutoML, and pipelines

B. Only email and word processing

C. Only DNS management

D. Only hardware repair

Correct Answer: A. Datasets, training, deployment, notebooks, AutoML, and pipelines

Why this is correct: Datasets, training, deployment, notebooks, AutoML, and pipelines directly matches the concept covered by the question.

Why B is incorrect: Only email and word processing does not match the concept being tested.

Why C is incorrect: Only DNS management does not match the concept being tested.

Why D is incorrect: Only hardware repair does not match the concept being tested.

Question 3: Where can datasets be stored for ModelArts workflows according to the course?

A. Huawei Cloud OBS

B. A monitor

C. A keyboard

D. A local printer only

Correct Answer: A. Huawei Cloud OBS

Why this is correct: Huawei Cloud OBS directly matches the concept covered by the question.

Why B is incorrect: A monitor does not match the concept being tested.

Why C is incorrect: A keyboard does not match the concept being tested.

Why D is incorrect: A local printer only does not match the concept being tested.

Question 4: What is OBS used for in the course?

A. Cloud storage for datasets and models/data used in AI workflows

B. Model activation

C. Video display

D. CPU scheduling

Correct Answer: A. Cloud storage for datasets and models/data used in AI workflows

Why this is correct: Cloud storage for datasets and models/data used in AI workflows directly matches the concept covered by the question.

Why B is incorrect: Model activation does not match the concept being tested.

Why C is incorrect: Video display does not match the concept being tested.

Why D is incorrect: CPU scheduling does not match the concept being tested.

Question 5: What is AutoML intended to help with?

A. Automating parts of model building and experimentation

B. Replacing cloud storage

C. Managing monitor settings

D. Creating network cables

Correct Answer: A. Automating parts of model building and experimentation

Why this is correct: Automating parts of model building and experimentation directly matches the concept covered by the question.

Why B is incorrect: Replacing cloud storage does not match the concept being tested.

Why C is incorrect: Managing monitor settings does not match the concept being tested.

Why D is incorrect: Creating network cables does not match the concept being tested.

Question 6: What is Huawei HiLens?

A. A Huawei edge AI service/platform for deploying and running AI applications

B. A spreadsheet package

C. A database language

D. A text editor

Correct Answer: A. A Huawei edge AI service/platform for deploying and running AI applications

Why this is correct: A Huawei edge AI service/platform for deploying and running AI applications directly matches the concept covered by the question.

Why B is incorrect: A spreadsheet package does not match the concept being tested.

Why C is incorrect: A database language does not match the concept being tested.

Why D is incorrect: A text editor does not match the concept being tested.

Question 7: What is an event-driven HiLens application?

A. An application where an inference result can trigger a defined action or event

B. An application without inputs

C. A static PDF

D. A database backup

Correct Answer: A. An application where an inference result can trigger a defined action or event

Why this is correct: An application where an inference result can trigger a defined action or event directly matches the concept covered by the question.

Why B is incorrect: An application without inputs does not match the concept being tested.

Why C is incorrect: A static PDF does not match the concept being tested.

Why D is incorrect: A database backup does not match the concept being tested.

Question 8: What is ModelArts real-time inference?

A. Serving a deployed model for immediate request-based predictions

B. Processing only historical reports

C. Training without a model

D. Creating OBS buckets

Correct Answer: A. Serving a deployed model for immediate request-based predictions

Why this is correct: Serving a deployed model for immediate request-based predictions directly matches the concept covered by the question.

Why B is incorrect: Processing only historical reports does not match the concept being tested.

Why C is incorrect: Training without a model does not match the concept being tested.

Why D is incorrect: Creating OBS buckets does not match the concept being tested.

Question 9: What is batch inference?

A. Processing a collection of inputs as a batch rather than responding individually in real time

B. A method for camera calibration

C. A database schema

D. A Python loop only

Correct Answer: A. Processing a collection of inputs as a batch rather than responding individually in real time

Why this is correct: Processing a collection of inputs as a batch rather than responding individually in real time directly matches the concept covered by the question.

Why B is incorrect: A method for camera calibration does not match the concept being tested.

Why C is incorrect: A database schema does not match the concept being tested.

Why D is incorrect: A Python loop only does not match the concept being tested.

Question 10: Why are API endpoints useful for deployed AI models?

A. They allow applications to send inputs to the model and receive predictions

B. They replace all training data

C. They remove authentication

D. They prevent integration

Correct Answer: A. They allow applications to send inputs to the model and receive predictions

Why this is correct: They allow applications to send inputs to the model and receive predictions directly matches the concept covered by the question.

Why B is incorrect: They replace all training data does not match the concept being tested.

Why C is incorrect: They remove authentication does not match the concept being tested.

Why D is incorrect: They prevent integration does not match the concept being tested.

Question 11: What should API integration handle besides successful responses?

A. Errors and exceptions

B. Only screen brightness

C. Only image colors

D. Only filenames

Correct Answer: A. Errors and exceptions

Why this is correct: Errors and exceptions directly matches the concept covered by the question.

Why B is incorrect: Only screen brightness does not match the concept being tested.

Why C is incorrect: Only image colors does not match the concept being tested.

Why D is incorrect: Only filenames does not match the concept being tested.

Question 12: What does MLOps cover in the course?

A. Data, model, code, and deployment lifecycle management

B. Only graphic design

C. Only keyboard repair

D. Only document printing

Correct Answer: A. Data, model, code, and deployment lifecycle management

Why this is correct: Data, model, code, and deployment lifecycle management directly matches the concept covered by the question.

Why B is incorrect: Only graphic design does not match the concept being tested.

Why C is incorrect: Only keyboard repair does not match the concept being tested.

Why D is incorrect: Only document printing does not match the concept being tested.

Question 13: How does MLOps relate to DevOps?

A. It applies lifecycle and automation practices to machine learning workflows

B. It completely replaces software engineering

C. It is only about hardware

D. It has no relation to deployment

Correct Answer: A. It applies lifecycle and automation practices to machine learning workflows

Why this is correct: It applies lifecycle and automation practices to machine learning workflows directly matches the concept covered by the question.

Why B is incorrect: It completely replaces software engineering does not match the concept being tested.

Why C is incorrect: It is only about hardware does not match the concept being tested.

Why D is incorrect: It has no relation to deployment does not match the concept being tested.

Question 14: Which Huawei Cloud services are combined in the course's CI/CD example?

A. ModelArts, OBS, and FunctionGraph

B. Only HiLens and OCR

C. Only TensorFlow and PyTorch

D. Only Pandas and NumPy

Correct Answer: A. ModelArts, OBS, and FunctionGraph

Why this is correct: ModelArts, OBS, and FunctionGraph directly matches the concept covered by the question.

Why B is incorrect: Only HiLens and OCR does not match the concept being tested.

Why C is incorrect: Only TensorFlow and PyTorch does not match the concept being tested.

Why D is incorrect: Only Pandas and NumPy does not match the concept being tested.

Question 15: What is FunctionGraph used for in the course's CI/CD example?

A. Automating a post-inference or event-triggered task

B. Training every CNN manually

C. Displaying images

D. Replacing OBS storage

Correct Answer: A. Automating a post-inference or event-triggered task

Why this is correct: Automating a post-inference or event-triggered task directly matches the concept covered by the question.

Why B is incorrect: Training every CNN manually does not match the concept being tested.

Why C is incorrect: Displaying images does not match the concept being tested.

Why D is incorrect: Replacing OBS storage does not match the concept being tested.

Question 16: What is model drift?

A. A change in model behavior or performance caused by changing data or conditions

B. A change in monitor position

C. A Python syntax error

D. A change in PDF formatting

Correct Answer: A. A change in model behavior or performance caused by changing data or conditions

Why this is correct: A change in model behavior or performance caused by changing data or conditions directly matches the concept covered by the question.

Why B is incorrect: A change in monitor position does not match the concept being tested.

Why C is incorrect: A Python syntax error does not match the concept being tested.

Why D is incorrect: A change in PDF formatting does not match the concept being tested.

Question 17: What is CloudEye used for in the course?

A. Monitoring inference performance

B. Creating CNN layers

C. Extracting OCR text

D. Managing Python loops

Correct Answer: A. Monitoring inference performance

Why this is correct: Monitoring inference performance directly matches the concept covered by the question.

Why B is incorrect: Creating CNN layers does not match the concept being tested.

Why C is incorrect: Extracting OCR text does not match the concept being tested.

Why D is incorrect: Managing Python loops does not match the concept being tested.

Question 18: What can trigger a retraining pipeline in the course's drift example?

A. A detected drop in model performance or data drift

B. A new monitor

C. A changed keyboard

D. A renamed notebook

Correct Answer: A. A detected drop in model performance or data drift

Why this is correct: A detected drop in model performance or data drift directly matches the concept covered by the question.

Why B is incorrect: A new monitor does not match the concept being tested.

Why C is incorrect: A changed keyboard does not match the concept being tested.

Why D is incorrect: A renamed notebook does not match the concept being tested.

Question 19: Why are reproducibility and traceability important in MLOps?

A. They help teams understand and recreate how data, code, models, and deployments produced results

B. They eliminate the need for versioning

C. They prevent monitoring

D. They make evaluation unnecessary

Correct Answer: A. They help teams understand and recreate how data, code, models, and deployments produced results

Why this is correct: They help teams understand and recreate how data, code, models, and deployments produced results directly matches the concept covered by the question.

Why B is incorrect: They eliminate the need for versioning does not match the concept being tested.

Why C is incorrect: They prevent monitoring does not match the concept being tested.

Why D is incorrect: They make evaluation unnecessary does not match the concept being tested.

Question 20: Which course activity represents the final certification-readiness stage?

A. Mock exams, domain-wise practice, revision, capstone work, and official exam preparation

B. Only hardware repair

C. Only spreadsheet training

D. Only image resizing

Correct Answer: A. Mock exams, domain-wise practice, revision, capstone work, and official exam preparation

Why this is correct: Mock exams, domain-wise practice, revision, capstone work, and official exam preparation directly matches the concept covered by the question.

Why B is incorrect: Only hardware repair does not match the concept being tested.

Why C is incorrect: Only spreadsheet training does not match the concept being tested.

Why D is incorrect: Only image resizing does not match the concept being tested.

Final Answer Key

Phase 1 — Artificial Intelligence (AI)

1. A 2. A 3. A 4. A 5. A 6. A 7. A 8. A 9. A 10. A
